

Hand drill

Hand drills can be used to make holes in wood. Work out which size 'bit' you will need in the drill before you start drilling. Take care to drill in a straight line through the wood.

Set square

There are two types of set square. Each will enable you to draw an accurate right angle (90 degrees). Some will also help you draw angles of 30 degrees and 60 degrees; others will enable you to draw angles of 45 degrees. For best results, always begin with a straight horizontal line drawn with a ruler.
